
Purity User Info: puresetup

Overview

In Purity 4.8.0, a new user was introduced to allow for easier install of Pure Storage arrays. This user adds the ability to run a few extra commands that are necessary to install and set up Purity for the first time.

The puresetup user has access to the following commands:

- All *pureuser* commands
- The following additional commands:

```
pureinstall
puresetup
pureboot
mount
umount
hardware_check.py
sas_view.py
```

For this user, the kernel prohibits all network access, so ssh peer is not available. This user will also not be able to access any customer data.

The credentials for this user are as follows:

username: puresetup

password (including spaces):

embind anecdota praiser obelize

The install process is outlined here: https://support.purestorage.com/FlashArray/PurityOE/Purity_Upgrades/01_Upgrading_Purity/Array_Install%3A_Changing_Purity_Version_on_a_Fresh_Array

FAQ

Can I use this to upgrade an array?

No, this user only allows installs on a new or fresh array where Purity hasn't been started yet.

Can I use this to downgrade an array?

Purity does not support downgrades. Installing a lower version of Purity (compared to what was shipped from manufacturing) on a new or fresh array is not considered a downgrade in this case. However, if you install a version of Purity that is lower than 4.8.x, the puresetup user will not exist and the previous challenge-signer method must be used - therefore, installing a version of Purity prior to 4.8.x via this user is not recommended.
